Python Dictionary Programs - Questions and Answers

1. Create a dictionary to store a student's name, age, and course.

```
student = {
   "name": "Binty",
   "age": 22,
   "course": "BCom"
}
```

2. Print all keys in a dictionary.

```
print(student.keys())
```

3. Print all values in a dictionary.

```
print(student.values())
```

4. Access the value of a specific key.

```
print(student["course"])
```

5. Add a new key-value pair to a dictionary.

```
student["city"] = "Kottayam"
print(student)
```

6. Remove a key from a dictionary.

```
student.pop("city")
print(student)
```

7. Find the length of a dictionary.

```
print(len(student))
```

8. Check if a key exists in a dictionary.

```
if "name" in student:
   print("Key 'name' exists.")
else:
```

```
    print("Key 'name' does not exist.")
```

9. Clear all items from a dictionary.

```
student.clear()
print(student)
```
